

Disclaimer

Certain statements contained in this presentation and any documents referred herein are forward-looking statements, considered provisional. They are not historical facts and are based on a certain number of data and assumptions (both general and specific), risks and uncertainties that could cause actual results, performance or events to differ materially from those in such statements. Forward-looking statements are typically identified by words or phrases such as, without limitation, "anticipate", "assume", "believe", "continue", "estimate", "expect", "foresee", "intend", "may increase" and "may fluctuate" and similar expressions or by future or conditional verbs such as, without limitations, "will", "should", "would" and "could". Undue reliance should not be placed on such statements, as due to their nature they are subject to known and unknown risks and uncertainties.

As a result of the extreme and unprecedented volatility and disruption related to the financial crisis, SCOR is exposed to significant financial, capital market and other risks, including variations in interest rates, credit spreads, equity prices, currency movements, changes in government or regulatory practices, changes in rating agency policies or practices, and the lowering or loss of financial strength or other ratings. Forward-looking statements were developed in a given economic, competitive and regulatory environment and the Group may be unable to anticipate all the risks and uncertainties and/or other factors that may affect its business and to estimate their potential consequences. Such factors include among others:

- further instability affecting the global financial system and developments related thereto;
- further deterioration in global economic conditions;
- the cyclicality of the reinsurance industry;
- uncertainties in estimating reserves;
- uncertainties in estimating future claims for purposes of financial reporting, particularly with respect to large natural catastrophes, as significant
 uncertainties may be involved in estimating losses from such events and preliminary estimates may be subject to change as new information
 becomes available;
- the frequency, severity and development of insured claim events;
- acts of terrorism and acts of war;
- extraordinary events affecting the Group's clients and other counterparties, such as bankruptcies, liquidations and other credit-related events;
- current, pending and future legislation and regulation affecting the Group or its ceding companies and the interpretation of legislation or regulations.

The P&C loss development triangles as of December 2017 is provided by SCOR Re for informational purposes only. SCOR is under no obligation to, and does not intend to, update or revise any of the information included in the excel workbook or referred to in this presentation, whether as a result of new information, future events or other developments, even when any such new information, events or developments have been reflected in any report or other document published by SCOR or any of its business units. Although the information in the excel workbook bears directly on estimating loss reserves, it is not the only basis used by SCOR to establish its reserves.

P&C loss development triangles and reserves as of December 2017

A robust governance

- Triangles disclosure
- SCOR portfolio
- Appendices

A robust Governance coupled with a prudent reserving philosophy

SCOR overall reserving philosophy can be summarized as follows:

A robust governance insuring independent opinion and free from influence environment

Top of the class actuarial methods coupled with an holistic "four axis approach"

Instant reactivity to indications of potential negative developments

Conservative opening ultimate loss ratios applied on more recent underwriting years where statistical data is scarce

Hypothesis used in pricing systematically challenged and stress tests impact on pricing expected loss ratios taken into account

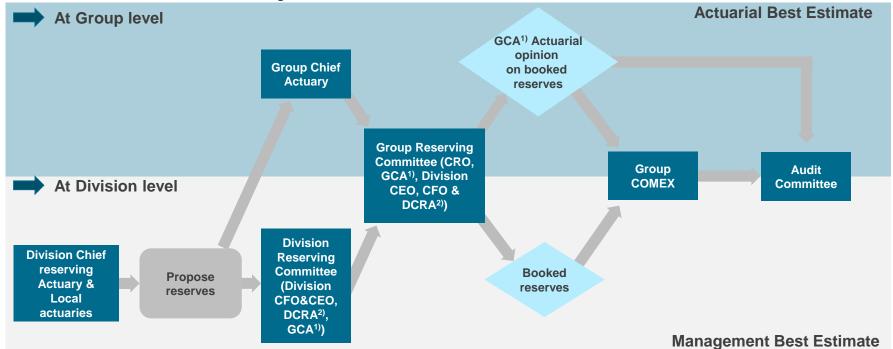

Extra time allowed to recognise positive run-offs, especially for mid and long tail classes of business

The quarterly reserving process

- As presented in the following chart, an initial booked reserves position is proposed by the division based on Division Chief Reserving Actuary's opinion. A first opinion on IFRS Best estimate position is formed by the Group Chief Actuary based on Division and Group Actuarial analyses
- Both are compared during the Group P&C Reserving Committee. The different views on claims and the main assumptions and approaches are compared and can result in a review of the different positions
- The final Group Chief Actuary actuarial best estimate position is then presented to the Group Executive Committee who
 validates the booked reserves
- Actuarial Best Estimate position and reserving adequacy is then shared by the Group Chief Actuary with Board Audit Committee as detailed in the following chart:

1) GCA: Group Chief Actuary

2) DCRA: Division Chief reserving Actuary

A free from influence environment

Division CEO

Group Chief Actuary

- Group corporate communication (rating agencies, Reference Document, ORSA report, Investors' day, Triangles disclosure, communication to the Board)
- ✓ Quarterly reserving adequacy opinion
- ✓ Implementation of the Solvency 2 Actuarial function throughout the Group
- Referral required at pre-defined thresholds on methodology / parameters
- ✓ Actuarial Function Holder for SCOR Group

Double reporting line Governance ensuring <u>independence</u>

Division Chief Reserving Actuary

- Reserving tools, method and parameters: warrant of consistency, standardization and compliance with guidelines and best market standards
- ✓ Produce best estimate liabilities.
- ✓ Provide support to their Division and to the Group Chief Actuary (e.g. Solvency 2 Actuarial Function)
- ✓ Enhance governance and controls at Division level (e.g. cross reviews, reserving committee)

The governance provides strong reviewing process and controls resulting in a high level of confidence

Top of the class Actuarial methods

Assessment of IBNR reserves and the variability of the overall reserves

- To assess IBNR reserves and the variability of the overall reserves, SCOR generally uses actuarial techniques which take into account quantitative loss experience data, together with qualitative factors, where appropriate
- This exercise is performed on homogenous groups of contracts, called actuarial segments having similar development pattern and a required statistical mass
- The reserves are also adjusted to reflect reinsurance treaty terms and conditions, and the variety of claims processing which may potentially affect SCOR's commitment over time

Methods used by SCOR

- SCOR uses among others:
 - Deterministic methods (e.g. Chain Ladder, Bornhuetter-Ferguson, Average cost per claim or Loss ratio methods) for Best Estimate assessment
 - Stochastic approaches (e.g. Mack model, Bootstrap) for reserves' volatility estimates
 - Experts judgments (e.g. exogenous a priori loss ratios based on P&C pricing or underwriters' departments, market benchmark)
 - Tailor made solutions like annuity projection by victim for non-standard segments (e.g. Motor and Medical Malpractice segments)

Top of the class Actuarial methods

Example of actuarial method Chain-Ladder

- Chain-Ladder is a deterministic method which consists in the analysis of the behavior of losses using historical data in order to estimate a development pattern
- The estimated pattern is applied to the latest diagonal of the triangle in order to project the ultimate loss

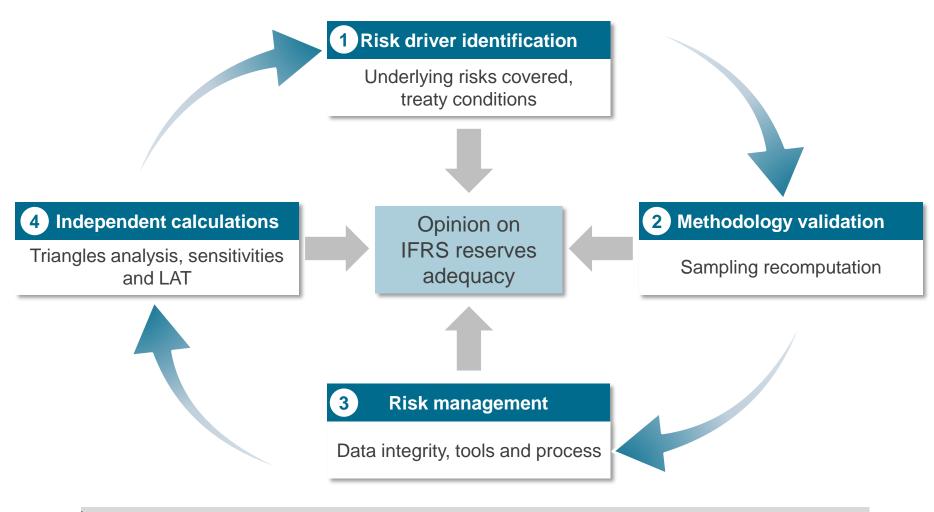

Example of actuarial method Mack model

- Mack is a stochastic model whose structure is based on the Chain-Ladder method
- It is distribution free and provides a measure of variability of the reserves

Total loss development triangle

Incurred loss development in loss ratios

Reserves higher than Best Estimate and consistent ultimate loss ratios

P&C's IFRS reserves are higher than Best Estimate

- IFRS Reserves level as at 2017 year-end are higher than SCOR Best estimate
- The prudent reserving approach leads to high confidence in P&C reserving adequacy

SCOR's strong reserving process reveals high level of confidence

Underwriting Year	Ultimate Premium € billion	Ultimate Loss Ratio 2016 as if 2017
2008	2.4	70.6%
2009	2.5	67.2%
2010	2.9	81.9%
2011	3.2	73.8%
2012	3.5	65.4%
2013	3.5	68.9%
2014	3.7	65.5%
2015	3.9	63.3%
2016	4.1	67.2%
2017	4.3	

Ultimate Loss Ratio 2017	Difference
70.1%	-0.5%
66.6%	-0.6%
81.2%	-0.8%
72.9%	-1.0%
66.1%	0.7%
67.5%	-1.4%
65.1%	-0.3%
63.5%	0.2%
67.2%	0.0%
83.3%	

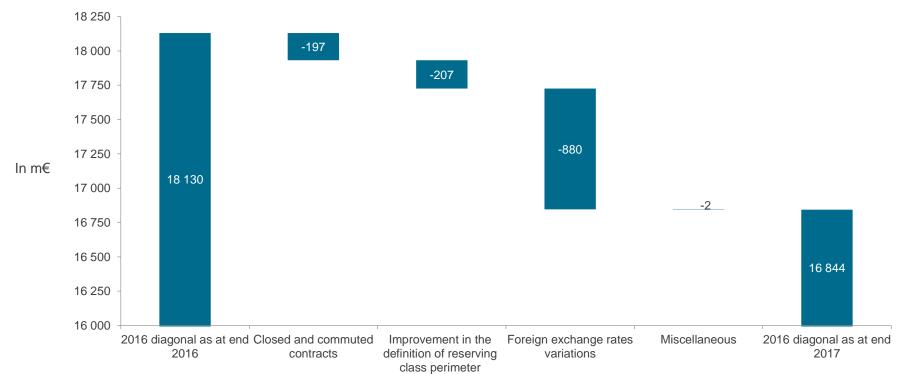

- The table reads as:
 - 1 Ultimate Loss Ratios (ULRs) 2016 on 2017 perimeter and Exchange rates
 - 2 2017 ULRs on 2017 perimeter
- Globally, ULRs develop positively from 2016 to 2017 calendar year
- The ULR for UWY 2017 is higher than average due to Cat losses.

Reconciliation to prior triangles

Reconciliation between 2016 diagonal as at end of 2016 and 2017

 The following graph provides reconciliation between the amount of incurred claims disclosed at year-end 2016 and year-end 2017 taking into account all available information at reserving class level. The main changes come from the variations in foreign exchange rates given the rise of the euro against other currencies.

Types of reinsurance

Facultative reinsurance

- The ceding company cedes and the reinsurer assumes all or part of the risks covered by a single specific insurance policy
- Facultative reinsurance is negotiated separately for each insurance contract that is reinsured
- Facultative reinsurance normally is purchased by ceding companies for individual risks not covered by their reinsurance treaties, for amounts in excess of the monetary limits of their reinsurance treaties or for unusual risks

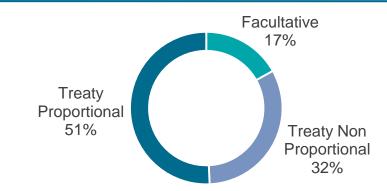

Proportional or quota share reinsurance

 The reinsurer, in return for a predetermined share of the insurance premium charged by the ceding company, indemnifies the ceding company against the same predetermined share of the losses of the ceding company under the covered insurance contracts

Non-proportional, or excess of loss or stop loss reinsurance

 The reinsurer indemnifies the ceding company against all or a specified portion of losses, on a claim by claim basis or with respect to a specific event or a line of business, in excess of a specified amount, known as the ceding company's retention or reinsurer's attachment point, and up to a negotiated reinsurance treaty limit

2008-2017 Reserves split by type of reinsurance

Lines of business description

Engineering

 It provides coverage for the risks inherent in the construction projects (from inception to completion). It covers all types of civil construction risks, plant and machinery breakdown risks as well as delay in start up coverage

Property

 The risks covered are classically fire, agriculture, machinery breakdown, and theft for private individuals, commercial or industrial risks

Proportional casualty

• The premium and reserves of this class are predominantly derived from our UK medical malpractice portfolio (long-term risks). A significant part of this class is also IDI business (Inherent Defect Insurance) in France and Spain. IDI provides coverage for inherent defects that are detected during a period starting at the completion of a construction/installation and expiring up to 10 years after completion of the works. This class also includes professional and personal liabilities but also D&O (Directors and Officers, in run-off) and WC (Workers Compensation mainly in the US)

Non-proportional casualty

 This class contains IDI (France and Spain mainly), medical malpractice (mainly France) and professional and manufacturing liabilities (heavy industry, food producers).
 Workers compensation business is also included (mainly in the US)

Marine, transport, aviation

 This class is dominated by the aviation risks. Aviation risks include products liability, hull and liabilities for airlines, general aviation and satellite risks. Marine and transport are basically insurance of hull and liabilities for merchant ships

Credit and surety

 This class mainly contains proportional business. The surety business is mainly performance bonds. The rest of the portfolio is credit insurance

Lines of business description

Motor non-proportional

- The main risk covered is auto liability
- The most important part of this class is motor third party liability on French market. The second largest part is motor third party liability on UK market
- Both premium and reserves are mainly related to bodily injury covers
- From a reinsurance point of view, this class is expected to have a longer development length than the motor proportional class, as only claims that overcome the threshold (as defined in the reinsurance contract) are concerned

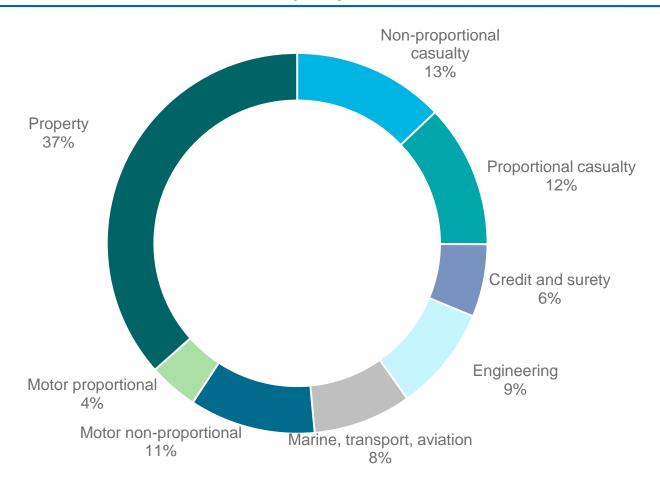

Motor proportional

- This class contains property damage covers as well as bodily injury covers
- Compared to the motor non-proportional class, this motor proportional class has a shorter development length
- This is explained by the more important weight of damages to property (short term risks) and the nature itself of this class (the claims reporting to the reinsurer is faster for proportional businesses)

Lines of business description

2008-2017 Reserves split by line of business

P&C loss development triangles and reserves as of December 2017

- A robust governance
- Triangles disclosure
- SCOR portfolio
- **Appendices**

Appendix 1: Large losses

- Depending upon which actuarial reserving method is used, the presence or absence of large natural catastrophe and manmade losses and how they are treated may have a significant impact on the estimated ultimate loss amount
- Only loss amounts exceeding €40m by underwriting year for Property and €15m for the other classes of business (on the disclosed perimeter) are shown in the table below

Underwriting year	Paid claims	Incurred claims	Main events by UWY					
Worldwide Property fire all natures including Nat Cat								
2008	113 350	118 058	Hurricane Ike					
2009	139 806	140 293	2010 Chile earthquake, Windstorm Klaus					
2010	352 443	371 422	New Zealand earthquake, Great East Japan earthquake					
2011	342 724	344 813	Thailand floods, New Zealand earthquake, Heavy rainfall in Denmark					
2012	86 000	91 376	Hurricane Sandy					
2013	305 825	314 479	Central European Flood, Hailstorm Andreas, Saint-Jude Storm, Fire in a China Semiconductor Company, Japan Snowstorm					
2014	88 916	90 665	European hail (Ela)					
2016	29 408	45 512	Fort McMurray Wildfire					
2017	131 092	426 619	California Wildfire, Hurricanes Harvey, Irma, Maria					
Worldwide marine, transport, aviation all natures								
2013	405	15 292	Disappearance of Malaysian Airline					
2014	36 959	44 210	Mexican Petrol Company - Abkatun Platform Fire					
Worldwide Cre	edit & Surety al	I natures						
2015	11 555	15 729	Abengoa					
Worldwide Ca	sualty non pro	portional and facult	ative - including PA, WC, IDI and Medical Malpractice					
2003	22 772	22 842	Pharmaceutical loss					
2005	16 017	16 017	US Homebuilders loss					
2010	15 064	15 064	Pharmaceutical company (Herbicide)					
2012	13 534	21 081	Bayou Corne sinkhole					

Appendix 2: Positive development vs Reserve release

Positive development

- In the case where the new estimation of an incurred following e.g. claims review/new information is lower than expected, the reserves related to this incurred can be lowered
- Such movement does not have any impact on the margin as it is just a reflection of the actual estimation
- This movement is called a positive development

Reserve release

- Contrary to the positive development, in this case, the reserve reduction movement is not related to any new information or claims review but, usually, to a management decision
- Therefore, such movement has an impact on the margin
- In this event, this movement is called a reserve release

Appendix 3: External auditors (EY and Mazars) statement

- On our request, procedures have been performed in 2018 by SCOR external auditors which has led to a "Report of the
 findings of the statutory auditors of SCOR SE resulting from the agreed-upon procedures relating to the Loss Development
 Triangles for the year ended 2017". The objective was to provide SCOR with their findings regarding the quality and the
 completeness of the loss development triangles disclosed. These procedures as defined by us covered quality and
 completeness of data disclosed, correct consolidation of the triangles and controls of process leading to the production of the
 Ultimate Loss Ratios as well as the "As-if" figures.
- As part of the procedure, SCOR external auditors have found that the disclosed triangles reconcile with the underlying data; the triangles have been consolidated with no exception found, the process leading to the production of the Ultimate Loss Ratios as well as the "As-if" figures did not raise any exception and the document accompanying the triangles is a fair reflection of the way in which the triangles are actually built.
